- **Scissors** cuts Paper.
- **Paper** covers Rock.

In a gambling context, players stake real currency-- typically fiat or cryptocurrency-- versus a home dealer, an automatic algorithm, or another player in a peer-to-peer (P2P) match.

Requirement Game Modes

1. **Gamer vs. House (PvH):** The player wagers against an online gambling establishment platform. The gambling establishment uses a Random Number Generator (RNG) or provably reasonable system to choose its toss at the same time with the player.
2. **Player vs. Player (PvP):** Two human challengers place equivalent bets into a pot. Both send their choices secretly (typically through a smart contract on a blockchain), and the system exposes them concurrently. The winner takes the pot, minus a little platform fee (rake).
3. **Best of Series:** To lower the house edge or variance, video games are often played as a "Best of 3," "Best of 5," or "Best of 7."

The Mathematics and Odds

At very first glimpse, Rock Paper Scissors is a game of complete balance. With 3 options, a completely random gamer has a **33.33% chance of winning**, a **33.33% chance of losing**, and a **33.33% possibility of tying**.

Result Probability (Single Round) Standard Payout (Even Money) **Win** 33.33% 1:1 (Double your cash) **Loss** 33.33% Lose stake **Connect** 33.33% Push (Stake returned or replayed)

Understanding your home Edge

- **The P2P Rake:** In peer-to-peer gambling platforms, your home takes a little percentage (generally 1% to 5%) of the overall pot for hosting the match.

Psychology and Strategy: How to Gain an Edge

Due to the fact that Rock Paper Scissors people are notoriously bad at being really random, gamers who understand behavioral psychology can drastically improve their win rates versus human opponents (and sometimes poorly programmed bots).

Typical Human Biases in Rock Paper Scissors

- **The Win-Stay, Lose-Shift Pattern:** When players win a round, they tend to toss the same winning indication again. When they lose, they tend to switch to the indication that *would have* beaten what simply defeated them.
- **The Rock Bias:** Novice gamers throw Rock regularly than Paper or Scissors in the opening round because it feels psychologically "more powerful" and more aggressive.
- **The Gambler's Fallacy:** If a player throws Paper three times in a row, opponents greatly assume they will change to Rock or Scissors on the fourth throw.

Proven Winning Strategies

- **The Conditional Response Strategy:** Anticipate your challenger's response to the previous round. If you won the last round with Rock, anticipate your opponent to switch to the item that beats Rock (Paper). For that reason, you need to toss Scissors.
- **Game Theory Optimal (GTO):** Play with absolute randomness. Use a digital randomizer or completely separate your mind from pattern-making so that your challenger can not exploit your habits. This guarantees you will not lose over a long sample size, though it caps your winning prospective to luck.
- **Exploitative Play:** If you observe a challenger heavily prefers Paper, stop randomizing and exclusively throw Scissors up until they adapt.
