The facility is simple: a multiplier begins at **1.00 x** and begins to climb up upward. A virtual things-- frequently represented as a rocket, a jet, or a terrorist with a C4 charge-- ascends, and the multiplier increases alongside it. The objective for the player is to **"cash out"** before the multiplier arbitrarily "crashes."

If a player cashes out at 2.50 x, they win their preliminary wager increased by 2.50. However, if the game crashes before they squander, they lose their whole bet for that round.

How a Standard Round Works

4. **The Cash Out:** Players click the "Cash Out" button whenever they choose. Their payment is secured at that precise multiplier.
5. **The Crash:** The game stops climbing up at an established, randomly generated point. Those who stopped working to squander before this point lose their bets.
