

What eventing horses need horse feed

Eventing horses need **horse feed** that backs training, competition, recovery, and day-to-day [horse food](#) health. The best ration is not simply the one with the highest calories; it is the one that meets the horse's **energy** needs while keeping the digestive system steady, the temperament manageable, and the body in good **condition**.

For most **eventing horses**, the foundation should be a **forage-based diet**. Good quality **forage** supplies **digestible fibre**, which is the safest long-term fuel source for horses in regular work. Fibre promotes **gut health**, encourages chewing, and helps maintain a calmer, more reliable supply of **slow-release energy**. That matters for a **performance horse** that must stay focused across dressage, cross-country, and show jumping.

Event horses also benefit from enough **protein** for **muscle development**, enough **calories** to avoid losing weight, and the right balance of **vitamins and minerals** to support recovery, hoof quality, and immune function. If the horse sweats heavily, **electrolytes** and good **hydration** become especially important. In practice, the best **horse feed** for [useful source](#) eventing tends to be one that boosts **stamina** without creating excess fizz.

A useful way to think about feeding event horses is this: feed the horse for **performance nutrition**, not just appetite. A horse that looks well fed but lacks top-line, loses weight in work, or becomes sharp and difficult may need a different balance of roughage, energy sources, and supplementation.

Categories of horse feed and how they work

There are several **types of horse feed**, and each functions differently. The main option is usually between grazing feed, **hard feed**, and mixed feeds such as forage mix, cubes, nuts, and blends. The right mix depends on the horse's activity level, body type, and response to feed.

Hard feed is a wide term that includes cereals, compound feeds, cubes, and mixes. It is often used to supply extra calories, protein, and vitamins when forage alone is not enough. Some hard feeds are designed for slow, steady conditioning, while others provide a quicker energy boost.

Chaff is chopped forage, often with added oil or molasses. It is helpful because it increases chewing time and can slow the rate of eating. Chaff can also improve **palatability** and help carry supplements through the bucket. For many eventing horses, chaff is a valuable part of feeding management because it supports roughage intake while making the ration more practical.

Oats remain a traditional energy source, and some horses thrive on them. They can provide a useful energy lift, but they are not ideal for every horse because they may be higher in **starch** and can produce a hotter response in sensitive animals. For that reason, oats suit some horses in intense work but are not automatically the best choice for every event horse.

Other ingredients frequently used in event horse diets include beet pulp, oil, and fibre-based cubes or pellets. These can improve digestibility and provide energy in a more controlled way than high-cereal rations. The ideal mix depends on the individual horse rather than on trends alone.

Is complete horse feed a suitable choice for eventing?

Complete horse feed can be an excellent solution for some eventing horses, especially if you want a less complicated feeding system. A true complete feed is designed to provide a **balanced ration** in one product,

often providing fibre, energy, protein, **vitamins and minerals**, and sometimes oil. For horses that are picky eaters or difficult to keep in condition, that can be highly useful.

The main advantage is practicality and consistency. If the feed is formulated well, it can reduce guesswork and help maintain a suitable **body condition score**. That can be very beneficial when you are juggling training, travel, and competition schedules. A complete feed can also support horses that need a controlled starch level, since many modern versions focus on fibre and oil rather than cereal-heavy formulations.

However, complete feed is not automatically the ideal choice for every horse. Some eventing horses do better on a forage-first plan with a **ration balancer** or separate supplement, especially if they already get enough calories from hay or haylage. If a horse holds weight well, a lighter ration may be enough. If a horse needs more calories, muscle support, or better cover, a complete feed may be a stronger match.

The key is to examine the label and the **feed analysis**. Compare digestibility, protein level, oil content, fibre source, starch, and sugar. A feed that looks like a complete ration on paper still needs to suit the horse's temperament, workload, and current condition. In other words, the best complete feed is the one that genuinely suits the horse rather than the one with the loudest marketing.

How to choose horse feed for beginners

If you're looking for **horse feed for beginners**, begin with the basics: evaluate the horse's current **bodyweight**, body condition, work level, and access to **forage**. New owners often focus too much on energy feeds and not enough on whether the horse is already getting enough roughage. A good feeding plan should first begin with forage quality and quantity.

Create a simple **feeding routine** and keep it as consistent as possible. Horses do best when their meals are offered at roughly the same times each day. Consistency supports gut function, reduces stress, and makes it easier to notice changes in appetite or droppings that could signal a problem.

For a horse in light work, forage may do most of the job. For an event horse in regular training, you may need to add a fibre-based conditioning feed, a balancer, or a performance mix. The best approach is to increase calories gradually and monitor the horse's coat, behaviour, and top line over time.

If you are unsure where to begin, think in this order:

- Review forage quality and intake first.
- Monitor body condition and weight regularly.
- Align feed to **workload**, not just breed or size.
- Add energy from digestible fibre and oil before relying heavily on starch.
- Review the ration whenever training intensity changes.

This approach makes horse feeding much easier for beginners and helps avoid overfeeding, underfeeding, or sudden changes that upset the digestive system.

Feeding rules for horses for every event rider to follow

Careful **horse feeding rules** can make eventing management more safe and more successful. Many riders use a version of the **10 rules of feeding horses**, even if they do not call them that. The details may vary, but the main principles are consistent: safeguard the gut, avoid big feed swings, and keep forage central.

To begin with, provide ample roughage and avoid long gaps without forage. Second, feed **small meals** rather than large buckets that overload the stomach. In addition, keep **fresh water** available at all times, especially around travel, training, and competition. Lastly, make any diet changes gradually over several days or longer.

Further important horse feeding rules include:

- Feed for the horse's current **workload** and body condition, not for an idealised plan.
- Do not depend on one ingredient to fix every issue.
- Keep cereal-based meals sensible if the horse is sharp or prone to digestive upset.
- Promote recovery with forage, hydration, and electrolytes after hard efforts.
- Observe manure, appetite, attitude, and body shape for early warning signs.

They matter because event horses often face fluctuating training intensity. A calm dressage schooling week may require different feeding than a demanding cross-country phase. Feed management should follow the horse's workload, not just a fixed routine set months ago.

How to use a horse feeding chart

A **horse feeding chart** helps turn feeding decisions into a structured plan. It is not a substitute for professional advice, but it is a valuable reference for matching the ration to the horse's **body condition score**, **workload**, and **forage intake**.

First, assess whether the horse is too thin, ideal, or carrying too much condition. Then review how much work the horse is doing each week and how intense that work is. A horse doing light flatwork needs a much different intake from a horse working hard in regular schooling, galloping, and jumping sessions.

When using a chart, check:

- The amount of forage is fed each day.
- Whether the ration supplies enough calories for the current workload.
- Whether the horse needs more protein for muscle development.
- Whether the horse is getting enough vitamins and minerals.
- Whether the feed supports a balanced, manageable temperament.

A chart is most useful when it ties feed choices to outcomes. If the horse is dropping condition, the chart should recommend increasing calorie density or forage intake. If the horse is too sharp, you may need to lower starch and increase digestible fibre or oil.

How much horse feed does an eventing horse need?

The portion of **horse feed** an eventing horse needs depends on size, temperament, forage access, and **workload**. Here is where a **horse feed calculator uk** can be handy, but it should merely be a starting point. Calculators can estimate daily intake, yet they cannot fully evaluate how the horse looks, feels, and performs.

A good estimate begins with **bodyweight** and forage intake. Then you include concentrated feed only if the horse needs more calories, protein, or micronutrients than forage alone can provide. Some horses in moderate

work maintain well on forage plus a balancer. Others need a full performance ration, especially if they find it hard to hold condition or are doing more demanding work.

If you use a **horse feeding chart** alongside a calculator, you can compare expected intake with actual results. Is the horse losing weight? Is the coat dull? Is recovery slow? Is energy inconsistent? These are more meaningful than simply feeding a fixed number of scoops.

For eventing horses, the goal is usually to keep the horse athletic, fuelled, and mentally settled. That often means enough roughage, controlled energy, and regular adjustment based on training. A horse that is too lean may lack strength and stamina; a horse that is overfed may become uncomfortable or difficult to ride. Balance matters more than bulk.

How much does horse feed cost?

Horse feed cost depends on the brand, kind of feed, bag size, and how many kilos the horse eats per day. A lower **bag price** is not always lower overall cost, because a more concentrated feed may be fed at a lower rate. That is why it is better to look at **daily feeding cost** rather than the bag price alone.

To compare value, weigh how much of the feed the horse actually needs each day. If one feed is inexpensive but requires a large feeding rate, it may end up costing more in the end than a higher-priced feed that is more nutrient-dense. This is especially relevant when comparing **horse feed companies**, because different brands may use different formulations, ingredient quality, and recommended intakes.

Also include the cost of forage, balancers, supplements, and electrolytes. A ration that looks cheap may become expensive if it still needs multiple add-ons. A more complete formula may be more economical if it meets the horse's needs in fewer products.

The most practical way to assess cost is to calculate monthly feeding cost based on the horse's actual ration. That gives you a clear comparison between feeds and helps you choose the most efficient option for the horse's workload and condition.

Should you choose branded feed like Spillers?

Spillers horse feed is one example of a branded option many riders consider for eventing. Branded feeds can be useful because they often come with clear feeding instructions, a stated **nutritional analysis**, and a range of products for different levels of work. For many riders, that makes feed management simpler.

Well-known **horse feed companies** typically offer specialised **performance feed** products, including low-starch, high-fibre, conditioning, and balancer options. That variety can help you tailor the ration to the horse's exact needs. The benefit is not the brand name itself; it is whether the product truly suits the horse's individual condition and workload.

Prior to choosing any named feed, review the components and nutrition profile. Check for digestible fibre sources, balanced oil content, reasonable starch and sugar levels, and a mineral profile that fits the rest of the diet. If a feed helps maintain consistent energy, recovery, and muscle condition without making the horse sharp, it may be worthwhile for the price.

Trademarked feeds can also help make feed management easier for busy riders because the instructions are straightforward to follow. Even so, a simple approach should never replace observation. Keep checking the horse's body condition, behaviour, and performance response.

Can you create a horse feed mix recipe?

A home-prepared **horse feed mix recipe** can work if you grasp the horse's dietary needs and ensure the ration balanced. Many riders combine a mix of forage, chopped straw, **beet pulp**, **pellets**, and **oils** to build a conditioning-focused diet that promotes slow-release energy and gut health.

Pulps from beets is particularly helpful because it delivers easily digested fibre and can be a solid source of calories without depending heavily on starch. Added oil can raise calorie density and improve coat condition while keeping the diet less heating. Pelleted feed can add structure, protein, and vitamins, depending on the product chosen.

Nevertheless, a home ration should still provide a proper balance of **vitamins and minerals**. Should you build a ration solely from ingredients without ever considering micronutrients, you may lead to shortages or surpluses. Because of this, many owners pair a custom mix with a balancer or supplement designed to round out the ration.

If you're looking to formulating your own mix, begin with a vet or nutritionist-approved plan. The goal is not to invent a novel recipe; the aim is to build a realistic ration that suits the horse's workload, temperament, and digestion. A self-made approach can work well, but only when it is managed carefully.

Horse feeding advice: what to avoid in event horses

Good **horse feed advice uk** typically starts with the things to avoid. Competition horses should steer clear of rapid diet switches, too much cereal feeding, long stretches without forage, and feed plans that push starch too high for the horse's disposition or gut tolerance.

Starch and **sugar** are not necessarily bad, but an overload can create extra fizz, erratic stamina, or gut strain. Horses that struggle with behaviour, tying-up risk, or gut sensitivity often do better on a low-starch, fibre-led ration with measured energy from oil and digestible fibre.

Another major risk is poor feed management around travel and competition. Changes in water intake, meal timing, and exercise routine can unsettle the gut and raise the chance of **colic**. Maintain routine where possible, offer water frequently, and avoid feeding large meals immediately before hard work.

Also avoid over-supplementing without checking the full ration. A horse can receive more than enough of one nutrient while still lacking another. The safest route is a carefully balanced plan that considers forage, hard feed, work, and body condition together.

FAQs about horse feed for eventing horses

What horse feed is best for eventing horses?

The best **horse feed** for eventing horses is usually forage-based, with added digestible fibre, sensible calories, and balanced **vitamins and minerals**. Many horses do well on a fibre-based conditioning feed, a balancer, or a complete feed that supports steady energy release and a calm, athletic frame.

Should eventing horses be on complete horse feed?

Complete horse feed can be a good choice for some eventing horses, especially if you want a straightforward **balanced ration** with fewer extra products. It is not essential for every horse, though. If forage already covers much of the diet, a balancer plus targeted feeds may work just as well.

How much horse feed should an event horse get each day?

The right amount depends on **bodyweight**, **workload**, forage access, and body condition. Use a **horse feed calculator uk** and a **horse feeding chart** as guides, then adjust based on the horse's condition score, appetite, and performance. The horse should stay in solid condition without becoming sharp or overweight.

How can I calculate horse feed cost per month?

To work out **horse feed cost** each month, times the daily feed amount by the bag cost per kilo, then use 30 as the monthly total. Also factor in the cost of hay, supplements, and any add-ons. Comparing daily feeding cost is often better than comparing **bag price** alone.

Which are the main horse feeding rules for performance horses?

The key **horse feeding rules** are to supply plenty of roughage, feed **small meals**, keep **fresh water** available, adjust rations gradually, and tailor feed to **workload**. Effective feeding management also means keeping an eye on body condition, promoting gut health, and avoiding too much starch or sugar.
