Step
Description
1. Acquire Skins Players acquire cosmetic products (skins) through gameplay drops, marketplace purchases, or third-party exchanges.
2. Deposit to a Site The skin's market price is transferred to the gambling platform via Steam's trade system.
3. Convert to Platform Currency A lot of websites immediately transform the skin into a site-specific token (e.g., "credits," "coins") that can be bet.
4. Choose a Game Users choose a gambling mini-game-- roulette, crash, coin flip, and so on-- and position a bet utilizing their tokens.
5. Win/Lose Outcomes are usually figured out by a provably fair algorithm (hash-based) that the platform publishes for verification.
6. Withdraw Winners can request a trade-back of skins or transform tokens into money where the site supports fiat withdrawals.

Bottom line: The entire loop is moderated through Steam's trade API, which suggests that a gamer's Steam account should remain in excellent standing. A breach of Steam's terms (e.g., using third-party services that prevent the API) can lead to account restrictions.
